

LSU STUDENT RECREATION CENTER

Interior Railing
Baton Rouge, Louisiana USA

L-62

Following a three-year renovation and expansion plan, LSU University Recreation's (UREC) new Student Recreation Center reopened with enhanced facilities for fitness, wellness, aquatic and outdoor adventure. The 250,000-square-foot facility, designed by HOK, utilizes Banker Wire's L-62 woven wire mesh as infill panels for the extensive amount of railing used through the facility.

The versatile look of Banker Wire's L-62 high-definition lock crimp appeals to both restoration and new-build projects. The unique crimp features straight sections of wire with highly defined crimps at the points of intersection, lending itself to a smooth appearance to complement the sleek design of the recreation center. Providing strength and durability, this woven wire mesh pattern is ideal for withstanding heavy use and providing substantial fall protection. The large percent open area of L-62 also gives various areas of the UREC separation without completely blocking line of sight.
